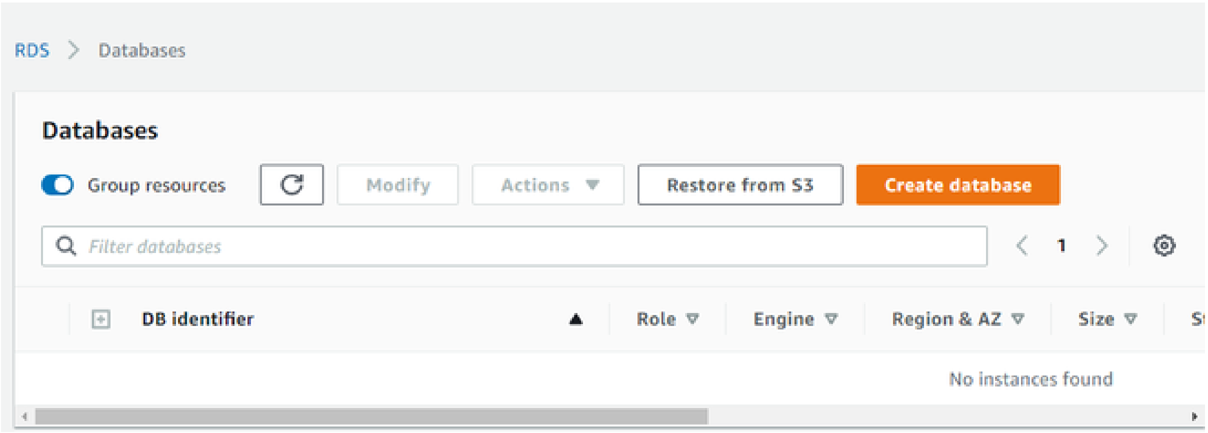
Steps to Create a Amazon RDS DB instance

Follow these steps to create an RDS DB instance using the AWS Management Console.

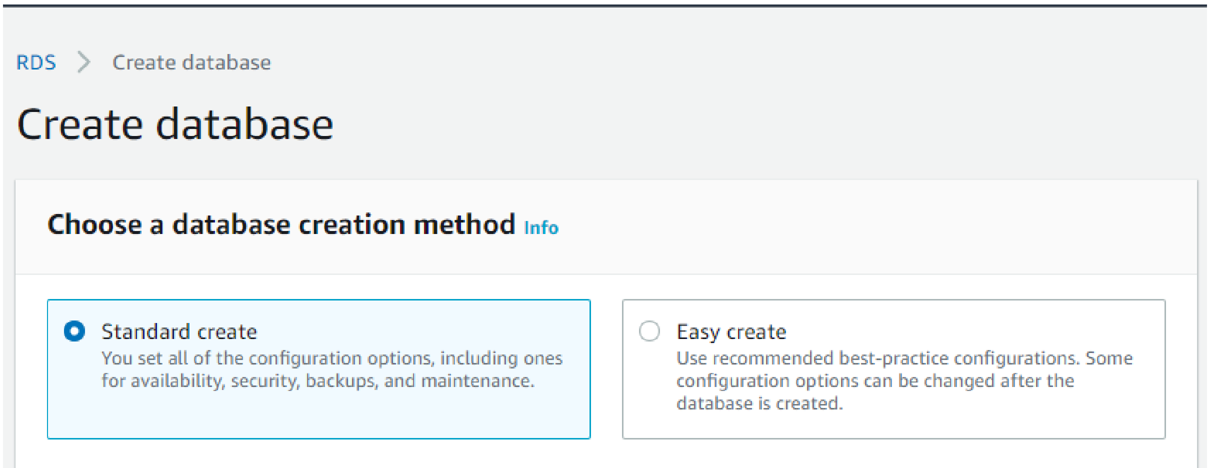
Step 1: Access the RDS Dashboard

- Log in to your AWS Management Console.
- Navigate to the **Amazon RDS** dashboard.
- Click on **Create Database** to start the setup process.



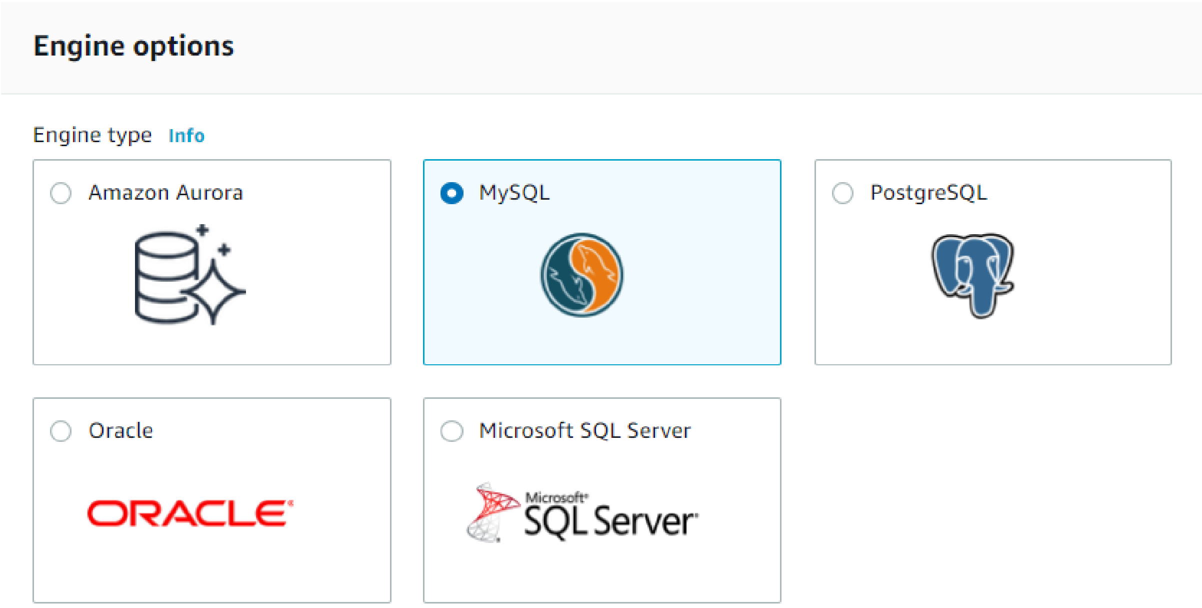
Step 2: Select a Database Engine

- Choose the **Standard database creation** method.

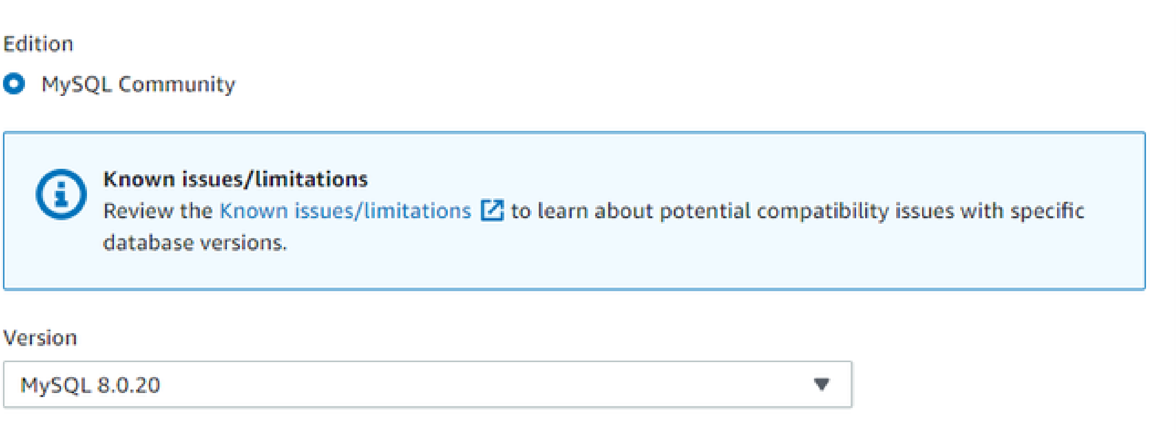


Creation Method

- Select the **MySQL** database engine (or any other engine based on your requirements).



- Select the version of the [MySQL] that you want to use.



Version of DB Engine

Step 3: Choose a Deployment Option

Under the **Templates** section, AWS offers three deployment options:

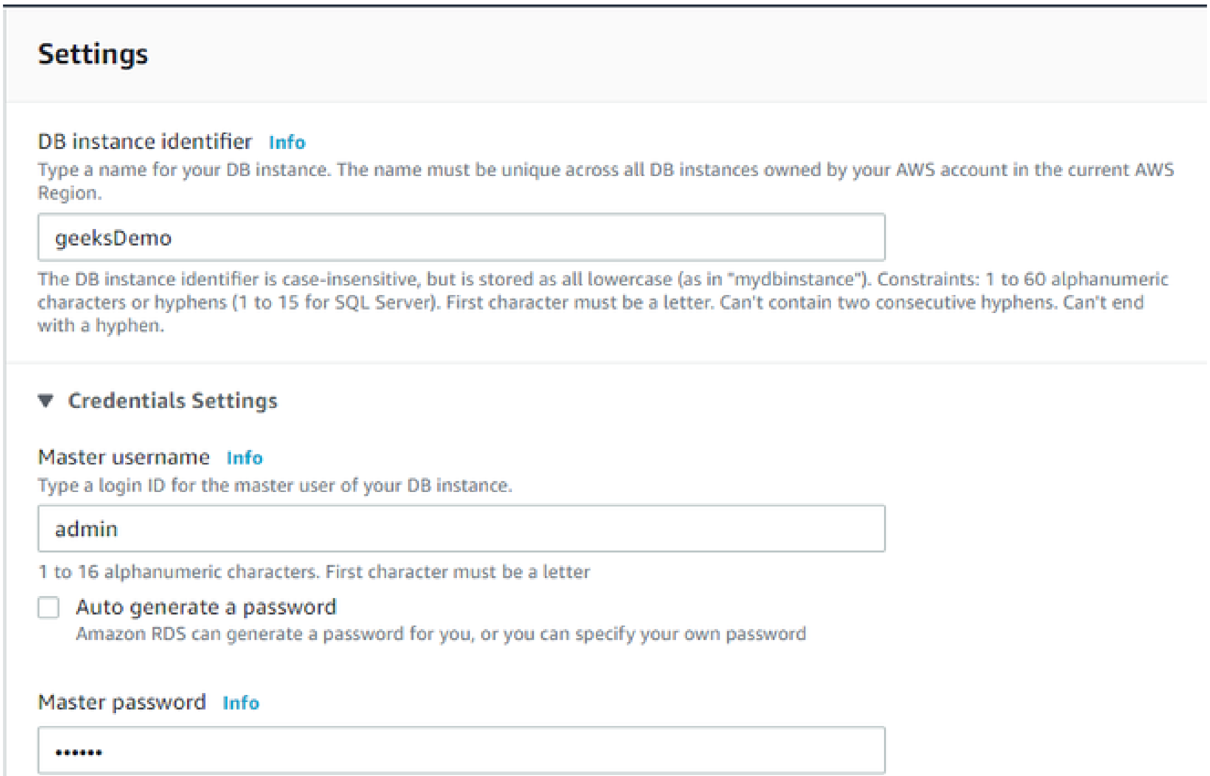
- **Production** – Suitable for high-performance applications.
- **Dev/Test** – Ideal for development and testing environments.
- **Free Tier** – Best for beginners and small-scale projects.

Template Types

We will opt for **Free tier.**

Step 4: Configure Database Settings

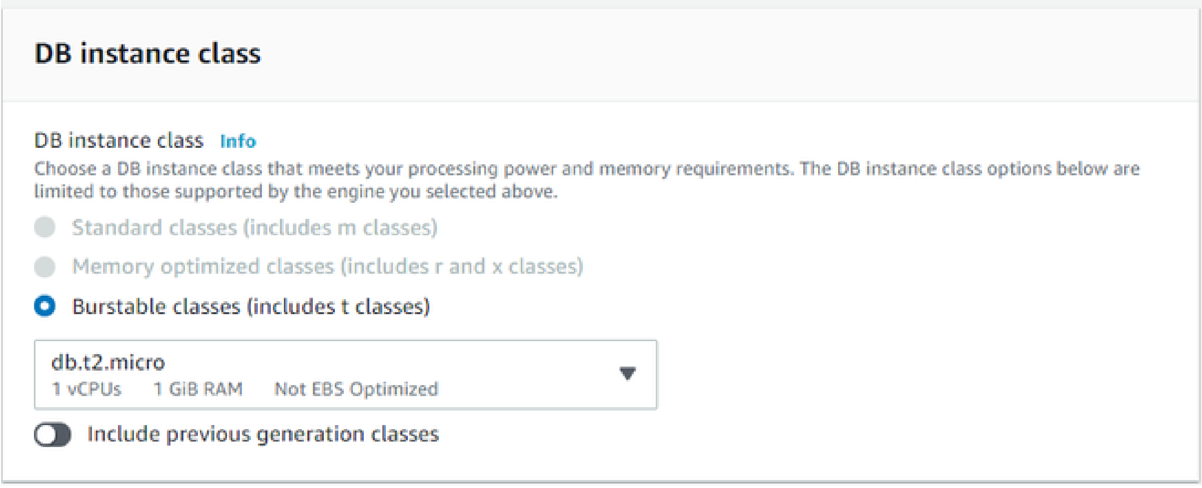
- Set the **DB instance identifier** (e.g., geeksDemo).
- Enter a **Master username** (e.g., admin).
- Choose a strong **password** for database access.



Settings

Step 5: Select an Instance Type

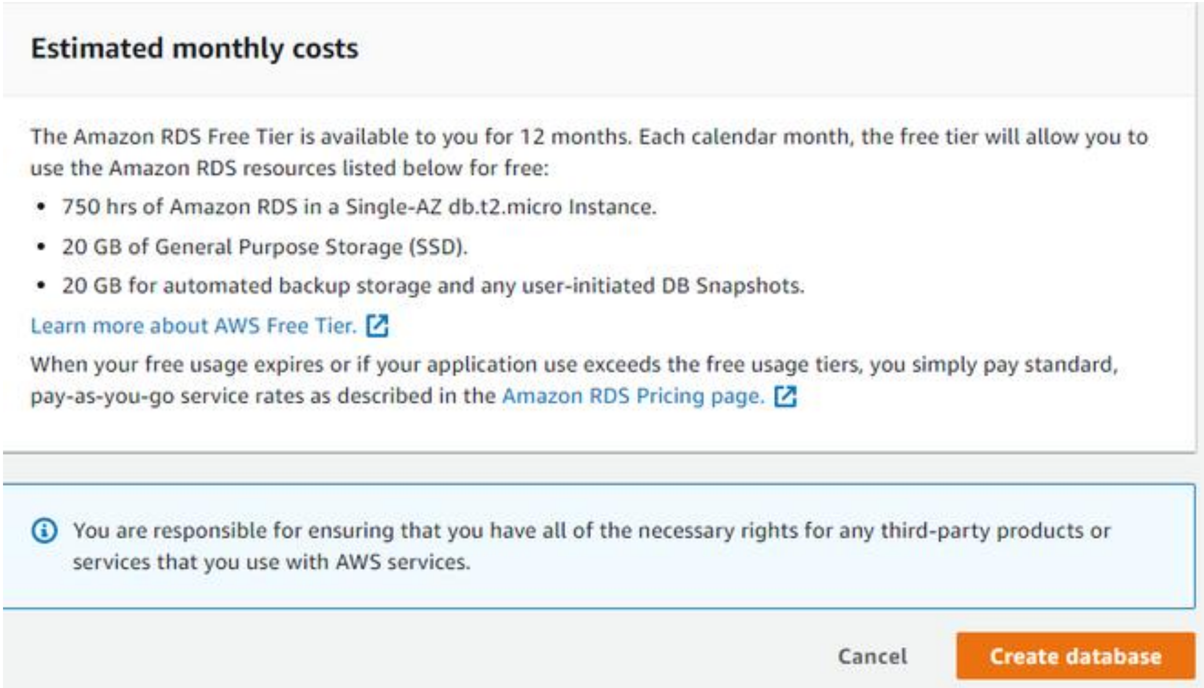
- The **db.t2.micro** instance type is automatically selected under the Free Tier.
- If needed, choose an instance that fits your workload.

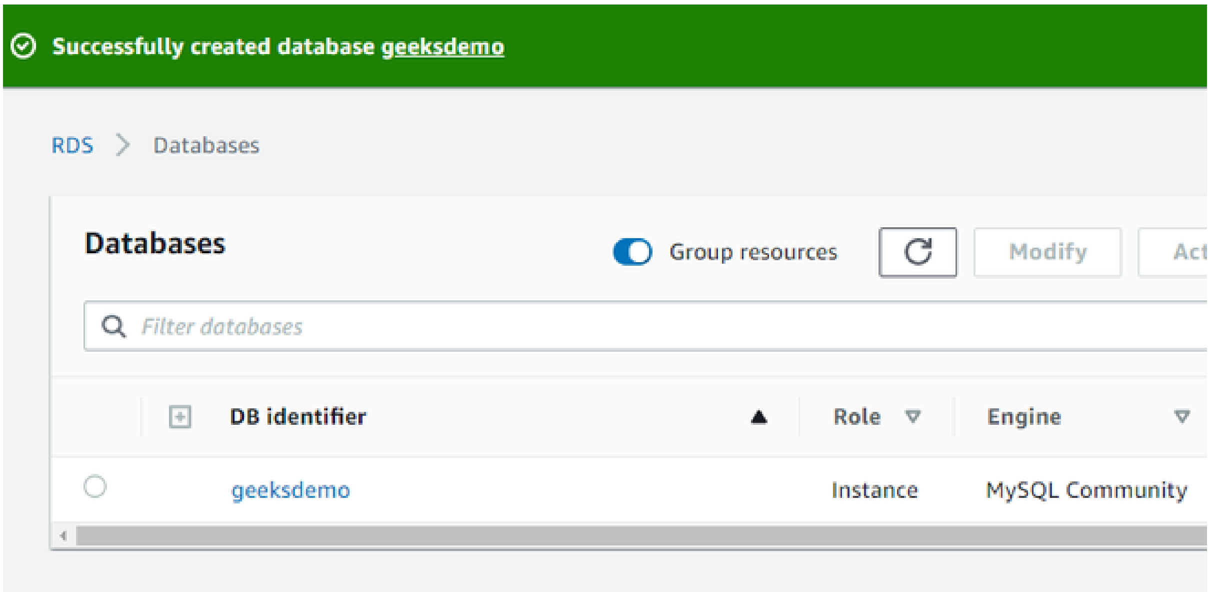


DB Instance

Step 6: Finalize and Create the Database

- Click **Create Database** to launch the instance.





In the above image, we see that a MySQL database named geeksdemo has been created.
