

Steps for AWS WAF :

Step 1: Create web ACL

Firstly [signing up for an AWS account](#) if you haven't already. Next, go to the AWS Console and search for "Web Application Firewall." This will take you to the AWS WAF home page, where you can select the option to create a new Web ACL

Create Web ACL

Before Going to next step, refer to the article - [Identity and Access Management \(IAM\) in AWS](#)

Step 2: Give a Name

Enter a name to identify your Web ACL. You can also add an optional description if desired. Once done, click "Next" to proceed

Give a Name

Click on "Next"

Step 3: Add an AWS Managed Rule Group

In this step, you'll need to add rules and rule groups. Select "Add managed rule groups", which will take you to a page where you can manage the rule groups, as shown in the reference snapshot

Add an AWS Managed Rule Group

Click on AWS Managed Rule Group

AWS Managed Rules offers a selection of predefined rule groups, most of which are free for AWS WAF users. Once you've added a managed rule group, save the configuration.

In this setup, we'll create two specific rules to define the traffic patterns we want to allow or block:

- **Regular Rule:** This rule protects the application against SQL injection attacks by checking if the URI path contains any SQL injection patterns.
- **Rate-Based Rule:** This rule blocks requests from the same IP address once they exceed a specified request limit within a given time frame.

Toggle "Add to Web ACL"

Click on "Add Rule"

After that, check the added rules and hit Next

Click on Next

Step 4: Configure Cloudwatch Metrics

The screenshot shows the 'Configure metrics' step of the AWS WAF console. On the left, a sidebar lists five steps: Step 1 (Describe web ACL and associate it to AWS resources), Step 2 (Add rules and rule groups), Step 3 (Set rule priority), Step 4 (Configure metrics), and Step 5 (Review and create web ACL). The main content area is titled 'Configure metrics' and includes an 'info' icon. It features a section for 'Amazon CloudWatch metrics' with a description: 'CloudWatch metrics allow you to monitor web requests, web ACLs, and rules.' Below this, there are two columns: 'Rules' and 'CloudWatch metric name'. Two rules are selected: 'AWS-AWSManagedRulesAnonymousIpList' and 'AWS-AWSManagedRulesCommonRuleSet', each with its corresponding metric name in a text box. A 'Request sampling options' section follows, with a note: 'If you disable request sampling, you can't view requests that match your web ACL rules.' It offers three options: 'Enable sampled requests' (selected), 'Disable sampled requests', and 'Enable sampled requests with exclusions'. At the bottom right, there are 'Cancel', 'Previous', and 'Next' buttons, with 'Next' highlighted in orange.

Configure metrics [info](#)

Amazon CloudWatch metrics
CloudWatch metrics allow you to monitor web requests, web ACLs, and rules.

Rules	CloudWatch metric name
☒ AWS-AWSManagedRulesAnonymousIpList	AWS-AWSManagedRulesAnonymousIpList
☒ AWS-AWSManagedRulesCommonRuleSet	AWS-AWSManagedRulesCommonRuleSet

Request sampling options
If you disable request sampling, you can't view requests that match your web ACL rules.

Options

- ☒ Enable sampled requests
- ☐ Disable sampled requests
- ☐ Enable sampled requests with exclusions

Cancel Previous **Next**

Step 5: Review Web ACL Configuration

In the final step, review all selected rules and managed rule groups to ensure they meet your requirements. Once confirmed, click "Create Web ACL" to complete the setup

The screenshot shows the 'Review and create web ACL' step of the AWS WAF console. The sidebar on the left highlights Step 5. The main content area is titled 'Review and create web ACL' with an 'info' icon. It is divided into two main sections. The first section, 'Step 1: Describe web ACL and associate it to AWS resources', includes a table for 'Web ACL details' with fields: Name (GFG020), Scope (REGIONAL), Description, Region (us-east-1), and CloudWatch metric name (GFG020). The second section, 'Steps 2 and 3: Add rules and set rule priority', shows a table for 'Rules (2)'. Below this, there are three summary cards: 'Web ACL capacity units (WCUs) used by your web ACL' (showing 750/5000 WCUs), 'Default web ACL action for requests that don't match any rules' (Action: Allow, Custom request headers: -), and 'Token domain list (0)' (No items to display). At the bottom, there is a 'Step 4: Configure metrics' section with an 'Edit step 4' button. The footer of the console shows the AWS logo, services menu, search bar, and user information.

Review and create web ACL [info](#)

Step 1: Describe web ACL and associate it to AWS resources [Edit step 1](#)

Web ACL details

Name	Scope
GFG020	REGIONAL
Description	Region
	us-east-1
CloudWatch metric name	
GFG020	

Steps 2 and 3: Add rules and set rule priority [Edit steps 2 and 3](#)

Rules (2)
If a request matches a rule, take the corresponding action. The rules are prioritized in order they appear:

Name	Capacity	Action
AWS-AWSManagedRulesAnonymousIpList	50	Use rule actions
AWS-AWSManagedRulesCommonRuleSet	700	Use rule actions

Web ACL capacity units (WCUs) used by your web ACL
The WCUs used by the web ACL will be less than or equal to the sum of the capacities for all of the rules in the web ACL.

The total WCUs for a web ACL can't exceed 5000. Using over 1500 WCUs affects your costs. [AWS WAF Pricing](#)

750/5000 WCUs

Default web ACL action for requests that don't match any rules

Action	Custom request headers
Allow	-

Token domain list (0)

Name
No items
No items to display

Step 4: Configure metrics [Edit step 4](#)

Click on "Create with ACL"

A confirmation message will appear saying, "You have successfully created Web ACL: [ACL-name]".
